Question 1 | Correct Mark 1.00 out of 1.00

Problem Statement:

Given a sorted array and a value x, the floor of x is the largest element in array smaller than or equal to x. Write divide and conquer algorithm to find floor of x.

Input Format

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Value for x

Output Format

First Line Contains Integer – Floor value for x

Answer: (penalty regime: 0 %)

```c
#include <stdio.h>
#include <stdlib.h>

int floorSearch(int arr[], int low, int high, int x) {
    if (low > high) {
        return -1;
    }

    if (arr[low] > x) {
        return -1;
    }

    if (arr[high] <= x) {
        return arr[high];
    }

    int mid = low + (high - low) / 2;

    if (arr[mid] == x) {
        return arr[mid];
    }

    if (arr[mid] < x) {
        // arr[mid] is a candidate; check if a better one exists on the right
        int rightResult = floorSearch(arr, mid + 1, high, x);
        if (rightResult == -1) {
            return arr[mid];
        }
        return rightResult;
    }

    // arr[mid] > x, floor must be in left half
    return floorSearch(arr, low, mid - 1, x);
}

int main() {
    int n;
    scanf("%d", &n);

    int *arr = (int *)malloc(n * sizeof(int));
    for (int i = 0; i < n; i++) {
        scanf("%d", &arr[i]);
    }

    int x;
    scanf("%d", &x);

    int result = floorSearch(arr, 0, n - 1, x);

    printf("%d\n", result);

    free(arr);
```
